1. read_csv() : Read a comma-separated values (csv) file into DataFrame.
2. columns : It is an inbuilt variable , which returns column names from the dataframe
3. info() : used to get information about the DataFrame
4. head() : used to get top **N** rows (default **N=5**)
5. tail() : used to get bottom **N** rows (default **N=5**)
6. fillna() : used to fill the missing values (None,NaN)
7. dropna() : auto detects the rows and columns which are having missing values and removes them
   axis=0 (remove the rows which are having missing values)
   axis=1 (remove the columns which are having missing values)
8. astype() : used to convert dtype of columns (dict can be passed as argument)
9. drop() : used to remove the specific row/column
   (index / columns) or (axis=0 / axis=1) can be used respectively.
10. rename() : used to change the name of the rows/columns
    (index / columns) or (axis=0 / axis=1) can be used respectively.
11. replace() : used to replace one or more old_vals by new_vals
    (dict can be passed as arg)
12. replace() : used to replace the all old_values by new_values
    (if not then replaces by NaN/None)
    (dict can be passed as arg)
13. reset_index() : used to reset the index which starts from ZERO
14. drop_duplicates() : Returns DataFrame with duplicate rows removed.
    (if not used on DataFrame then duplicates are replced by NaN/None)
